WORK EXPERIENCE

mrfood.ai

June 2026 – Present

Founding Engineering Intern

USA (remote)

- Built a **real-time bimanual teleop loop** driving **2× 6-DOF** AgileX PiPER arms from **Meta Quest** controllers **250 Hz** Pink/Pinocchio IK into a **100 Hz** SocketCAN loop with **3 m/s** jump-rejection and **180°/s** slew clamps hardened for remote use across **4** transports with `frame_seq` **packet-drop detection** and a **CAN circuit breaker** that held teleop stable over lossy networks.
- Owned the **data & observability pipeline**, **4** video paths (WebRTC/Agora/Adamo + isolated **GCS** recorder), arm/operator **telemetry** to **BigQuery** + **RGBD** to **GCS** via async sinks, **Prometheus & Grafana** monitoring with Slack alerting, and a **LeRobot** writer that chunked and pushed training-ready datasets to HuggingFace.

Emergent Labs

Mar 2026 – May 2026

Forward Deployed Engineering Intern

Bangalore

- Served as primary technical engineer for **50+ customers** running production apps, diagnosing and resolving Kubernetes (pod crashloops/scheduling), reverse-proxy, and container runtime failures across **~15 clusters**, cutting average support turnaround **~45%** and resolving **200+ infra incidents** while keeping high-traffic apps online at **99.9% uptime**.
- Built internal tooling for analytics, data, and ops teams, automating repetitive ETL and reporting workflows with [Airflow/cron jobs], and overhauling observability by instrumenting services with Prometheus metrics, Grafana dashboards, cutting mean-time-to-diagnosis and driving **~30%** productivity gains across engineering and support.

Successship Technologies

Jan 2025 – July 2025

Software Engineering Intern

Bangalore

- Improved system reliability and cut server costs **~20%** by triaging critical production issues and optimizing Docker images across **5+ services** through [base-image/multi-stage] build strategies and version upgrades.
- Led end-to-end development of a distributor management platform for direct-selling businesses, architecting core inventory (statistical analysis & classification), ledger/double-entry accounting, and payout services using [Spring Boot, Redis, PostgreSQL]; drove the company's first client signing and first successful payout through the system.
- Built an AI-powered AP/AR automation system from scratch using [LLM/OCR, LangChain/OpenAI], cutting manual invoice processing by **~40%**; ran **4+ client demos** that validated usability and shaped early product direction.

OPEN SOURCE (🔗 PR Dashboard)

OWASP Nest

- Enhanced the **frontend/UI** with new features for a better user experience; implemented **Django models** (with test files) for new features to ensure reliability and maintainability; shipped **SlackBot commands** to improve automation and team collaboration; and added **schema validations** while removing dead code for data integrity and a cleaner codebase.

LitmusChaos

- Strengthened **CI quality gates** through **Docker linting** integration, enhanced local setup scripts to **streamline contributor onboarding**, and maintained repository consistency via branding and asset updates.

Palisadoes Foundation

- Stabilized **CI/CD pipelines** with **reusable workflows** and advanced automation, improving build reliability and deployment consistency; led a **large-scale repository migration**; optimized **container images** for faster builds; and implemented production-grade **observability with OpenTelemetry** for improved monitoring and traceability.

PROJECTS

Wanderlust | AWS EC2, Kubernetes (self-managed), Docker, NodeJS, MongoDB, Redis 🔗

- Deployed a 3-tier cloud-native application on a self-managed Kubernetes cluster provisioned on AWS EC2; orchestrated workloads with Kubernetes Deployments, Services, and ConfigMaps.
- Designed the setup with a DevOps-first approach, focusing on infrastructure reliability & container orchestration.

VaultRAG | TypeScript, Cloudflare Workers, Vectorize, R2, D1, Workers AI 🔗 🌐

- Built a multi-tenant, privacy-first document Q&A platform running entirely on Cloudflare's edge (no third-party AI providers) using Workers AI (Llama 3.1, BGE embeddings), Vectorize, R2, and D1 across ten Cloudflare products.
- Built a complete RAG pipeline (PDF ingestion, sentence-aware chunking, Vectorize search, Llama 3.1 inference) processing **25 chunks/document in <60 s** with sub-second cached query response and observability via AI Gateway.

EDUCATION

Rishihood University, Haryana <i>Bachelor of Technology (CS & AI)</i>	Aug 2023 – Present CGPA: 8.5/10
---	------------------------------------

SKILLS

Programming Languages: Python, Java, JavaScript
Libraries & Frameworks: ReactJS, Node.js, ExpressJS, Spring Boot
Databases: SQL, MongoDB
Cloud & DevOps: CI/CD, Cloudflare, Linux, Nginx, Docker, OTEL, ECR, ECS, Kubernetes
Core CS: Object-Oriented Programming, Data Structures & Algorithms

KEY ACHIEVEMENTS

- **Google Developer Groups on Campus (GDG) '24 Lead** — Led flagship tech events, workshops, and community initiatives, strengthening the campus developer ecosystem in collaboration with Google’s GDG network.
- Achieved **All India Rank 1200** in ICPC-Prelims 2023.
